Early identification of neurobiological markers of remission

Michael Bodnar, PhD
Ashok K. Malla, MD
Martin Lepage, PhD

Outline

- Why study remission?
- Defining remission
- Data collection
- Results
 - neurocognition
 - neuroimaging: sMRI & fMRI
- Conclusions & Future Direction

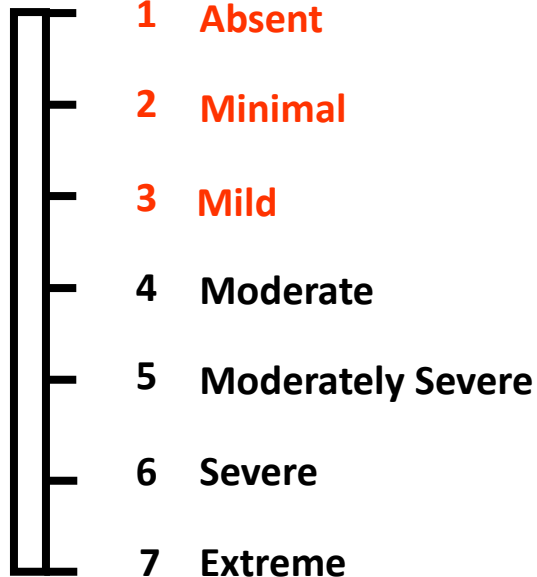

Why study remission?

- heterogeneity of outcome (Emsley et al, 2011, *Curr Opin Psychiatry*)
- inability to predict response early on
(Menezes et al, 2006, *Psychol Med*)
 - trial-and-error treatment strategy
 - ongoing assessments
 - careful monitoring of response and side-effects
(Tandon et al, 2010, *Schizophr Res*)
- the challenge: to better understand the heterogeneity of outcome following a first-episode of psychosis
 - identify markers of remission

Remission in schizophrenia

PANSS

level : mild or less

on all 8 core symptoms

- delusions
- hallucinatory behavior
- unusual thought content
- blunted affect
- passive or apathetic social withdrawal
- lack of spontaneity & flow of conversation
- mannerisms & posturing
- conceptual disorganization

sustained for at least 6 months

(Andreasen et al, 2005, *Am J Psychiatry*)

Data Collection

Symptom evaluations

Month 6

Month 12

Month 24

- Neurocognition
- Neuroimaging
 - structural MRI
 - functional MRI
 - DTI

- Neurocognition
- Neuroimaging
 - structural MRI

- Neuroimaging
 - structural MRI
 - DTI

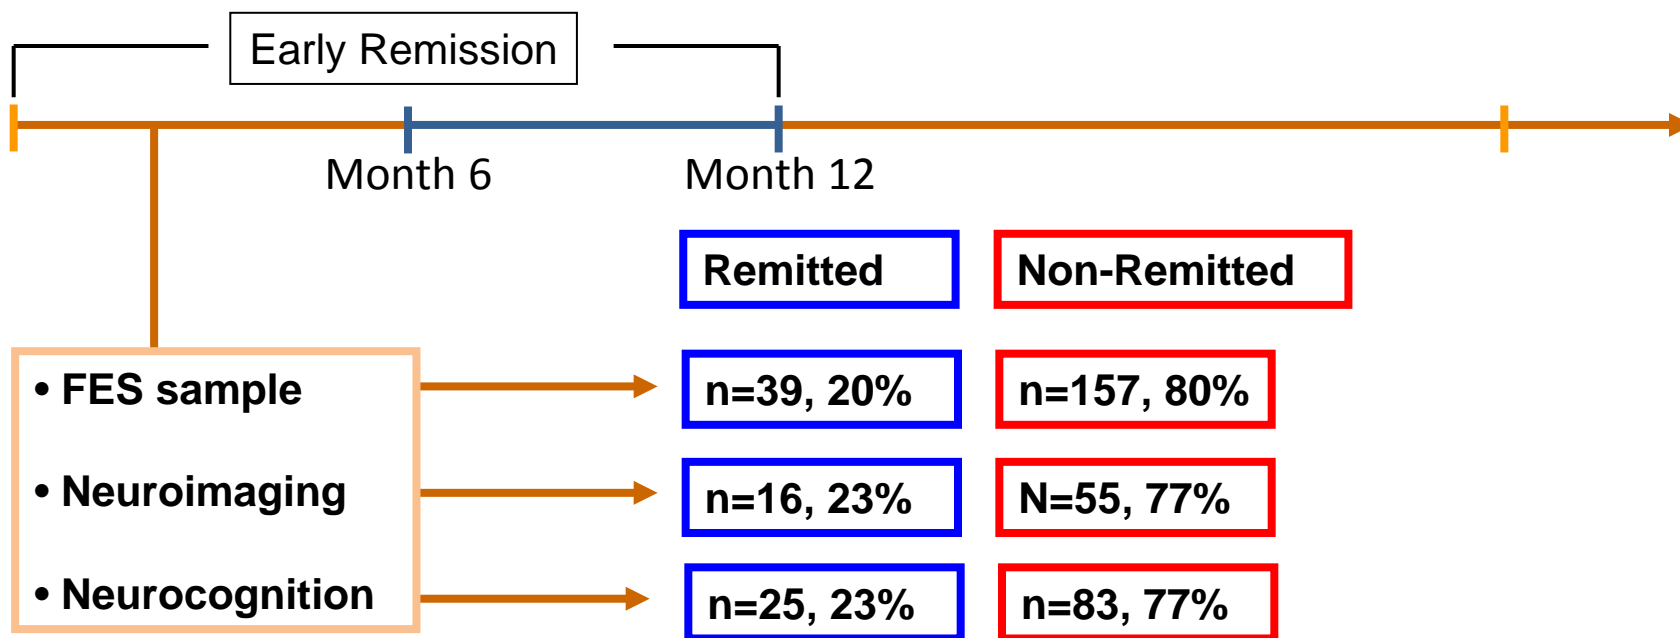

Since 2003

- 500+ clients treated

Since 2004

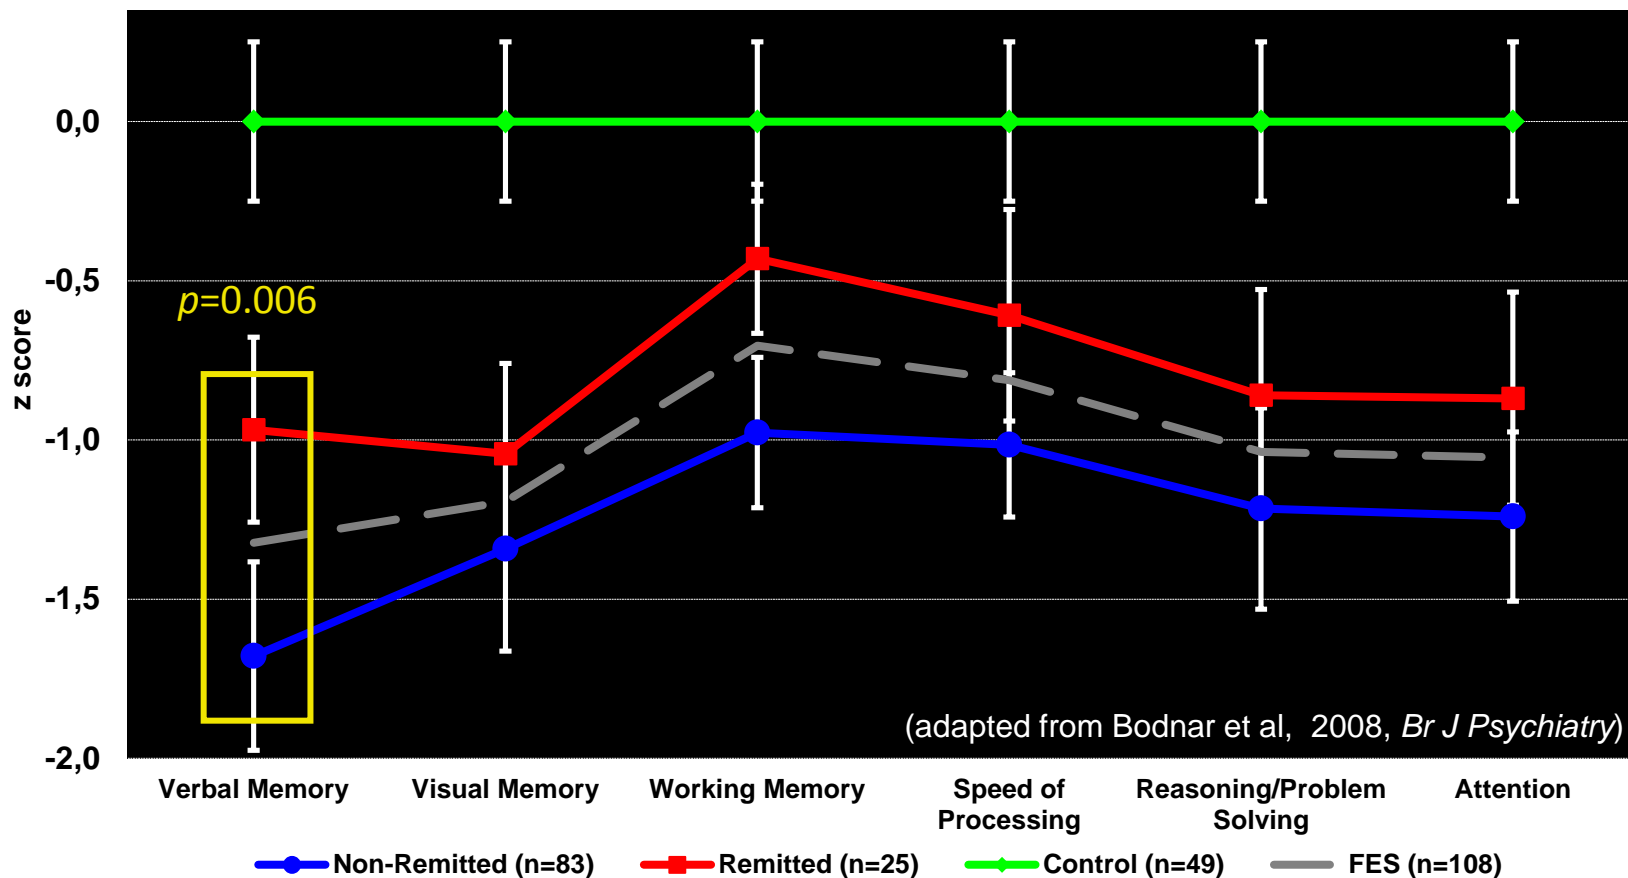

- sMRI: 135 initial, 68 fup1, & 47 fup2

Remission Rates

- Percentages in line with other studies (Emsley et al, 2011, *Curr Opin Psychiatry*)
– rates varied from 19% to 88%

Neurocognition

(adapted from Bodnar et al, 2008, *Br J Psychiatry*)

Automated whole-brain analysis (VBM8)

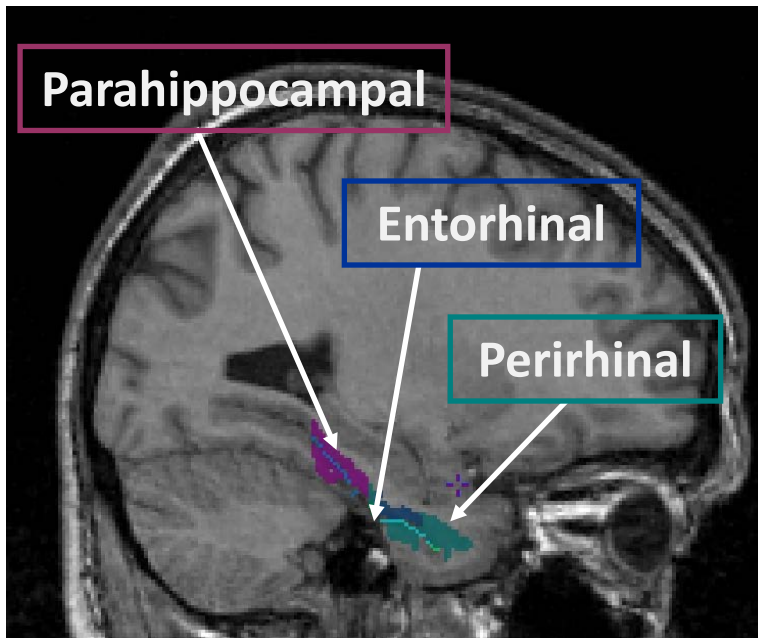

right parahippocampal gyrus

left hippocampus

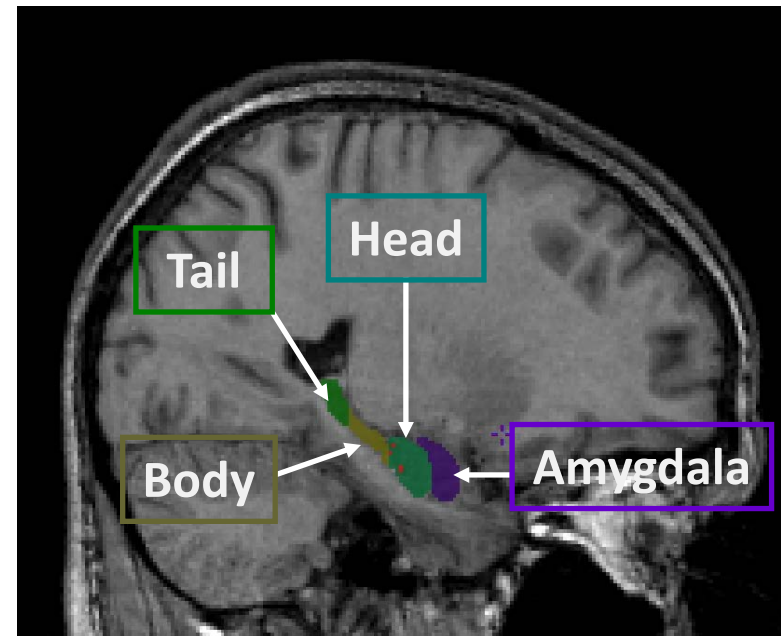

Areas with lower grey matter in non-remitted (n=41) compared to remitted (n=17) ($p < 0.001$, uncorrected)
(adapted from Bodnar et al, 2011, *Clin Schizophr Related Psychoses*)

Parahippocampus & Hippocampus

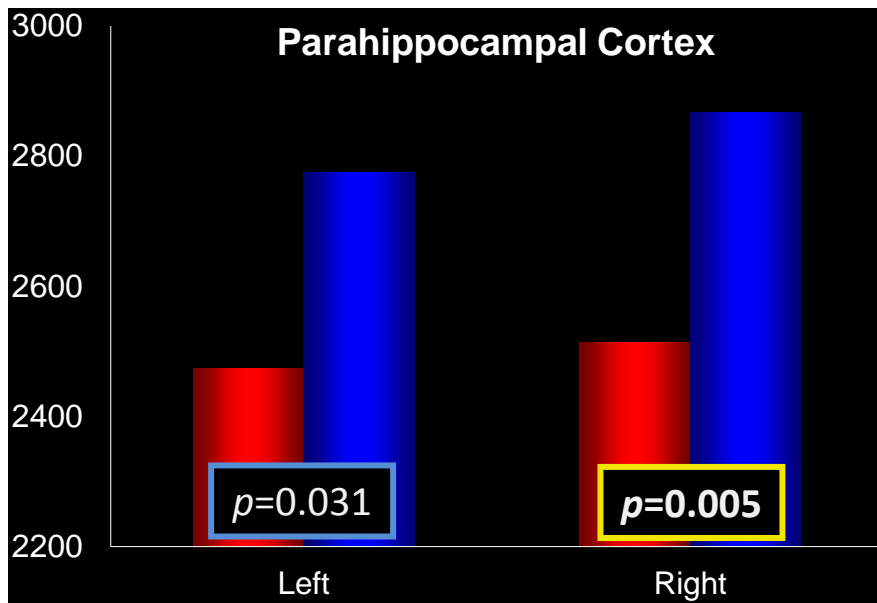

(Pruessner et al, 2002, *Cereb Cortex*)

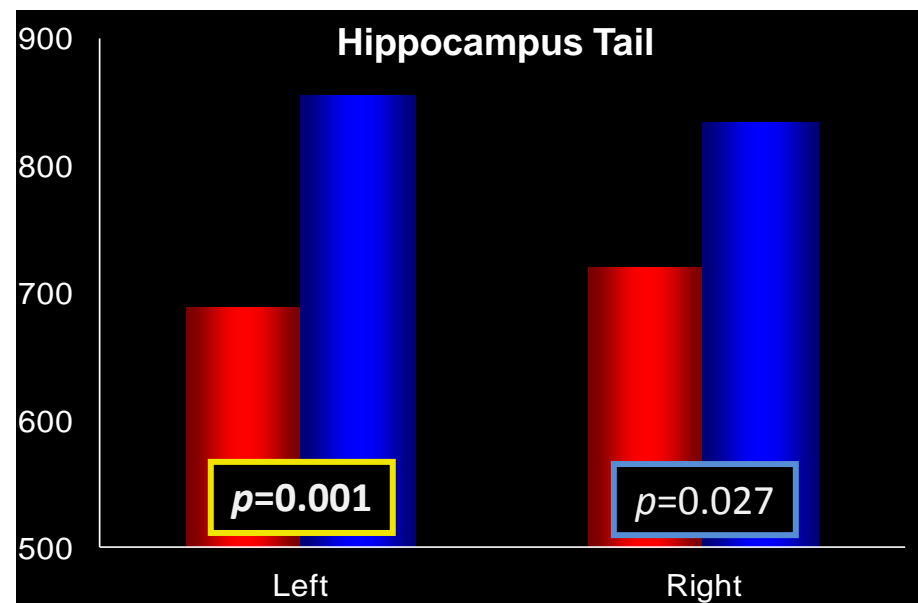

(Pruessner et al, 2000, *Cereb Cortex*)
(Bodnar et al, 2010, *Schizophr Res*)

Verifying the VBM results...

(adapted from Bodnar et al, 2012, *Psychiatry Res*)

Correlation, Right Side
Social Withdrawal: -0.351 , $p=0.008$
Verbal Memory: 0.349 , $p=0.009$

(adapted from Bodnar et al, 2010, *Schizophr Res*)

There were no significant or trend-level correlations.

■ Non-Remitted (n=41) ■ Remitted (n=17)

fMRI Behavioral Task

Which one is bigger?
Encoding Strategy

**Semantic
Relatedness**

	Associative	Item-Oriented
Related	Associative-related	Item-related
Unrelated	Associative-unrelated	Item-unrelated

2x2 design

(Achim et al, 2007, *JAMA Psychiatry*)

Related > Unrelated: Non-Remitted > Remitted

Posterior cingulate in schizophrenia:

- remains overactive when mentally engaged

(Garrity et al, 2007, *Am J Psychiatry*; Meda et al, 2009, *PLoS One*; Whitfield-Gabrieli et al, 2009, *Proc Natl Acad Sci USA*)

- hyper-activity → worse memory

(Meda et al, 2009, *PLoS One*; Whitfield-Gabrieli et al, 2009, *Proc Natl Acad Sci USA*)

- PCC fails to “turn off” leading to over-sampling and unfocused attention → poorer memory (Broyd et al, 2009, *Neurosci Biobehav Rev*; Mannell et al, 2010, *Hum Brain Mapp*)

Non-Remitted

Remitted

Summary of results

- Non-Remitted:
 - poorer verbal memory
 - smaller hippocampus tail & parahippocampal cortex
 - abnormal activity in posterior cingulate
- Posterior memory-related neural network differences between remitted & non-remitted FES patients
- Markers identified may be related to either positive or negative symptoms or both

Conclusions & Future Directions

- A better understanding of clinical outcome and of schizophrenia
- Highlight specific areas for future clinical research – developing newer, target-specific treatments
- Negative (and positive) symptoms should be explored in further detail to determine specificity of markers related to remission

Thank you

All personnel at PEPP

- Dr. Srividya Iyer
- Dr. Ridha Joober
- Dr. Ashok Malla

All current and former lab members

- Hazel Sutton
- Audrey Benoit
- Jennifer Dell'Elce
- Dr. Amelie Achim
- Dr. Philippe-Olivier Harvey

- Dr. Martin Lepage

All of the clients and especially those who have kindly given their time to take part in our research.

Symptomatic profiles

Positive Symptom Total

Negative Symptom Total

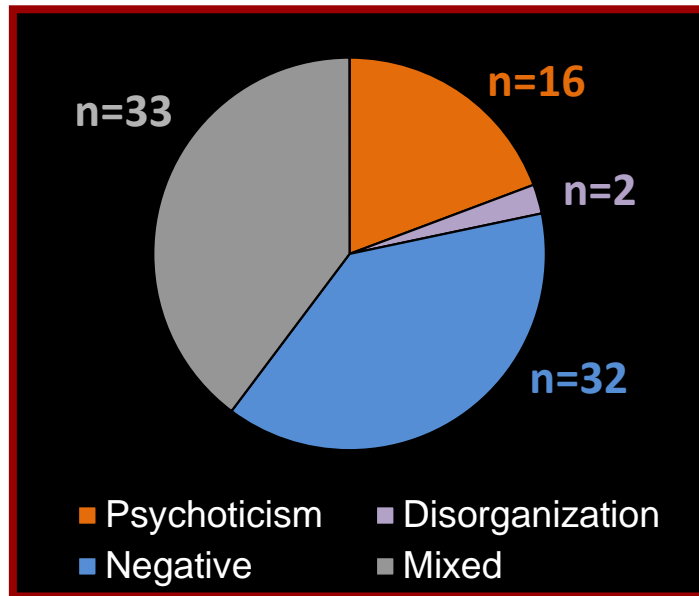

* $p < 0.01$ * $p < 0.001$

■ Non-Remitted (n=83)
■ Remitted (n=25)

Negative symptoms in remission

Non-Remitted

n=83, 77%

Correlation:

Parahippocampal
Cortex and Social
Withdrawal

Right, -0.351 , $p=0.008$

Left, -0.297 , $p=0.026$

Individual symptoms for not achieving remission:

1 – delusions; 3 – hallucinations

2 – conceptual disorganization

7 – blunted affect; 12 – social withdrawal; 2 – lack of spontaneity

Remitted vs. Non-Remitted

1 year

Non-Remitted	Remitted
n=157, 80%	N=39, 20%

2 year

Non-Remitted	Remitted
n=113, 72%	N=53, 32%

R → NR: 9

NR → R: 14

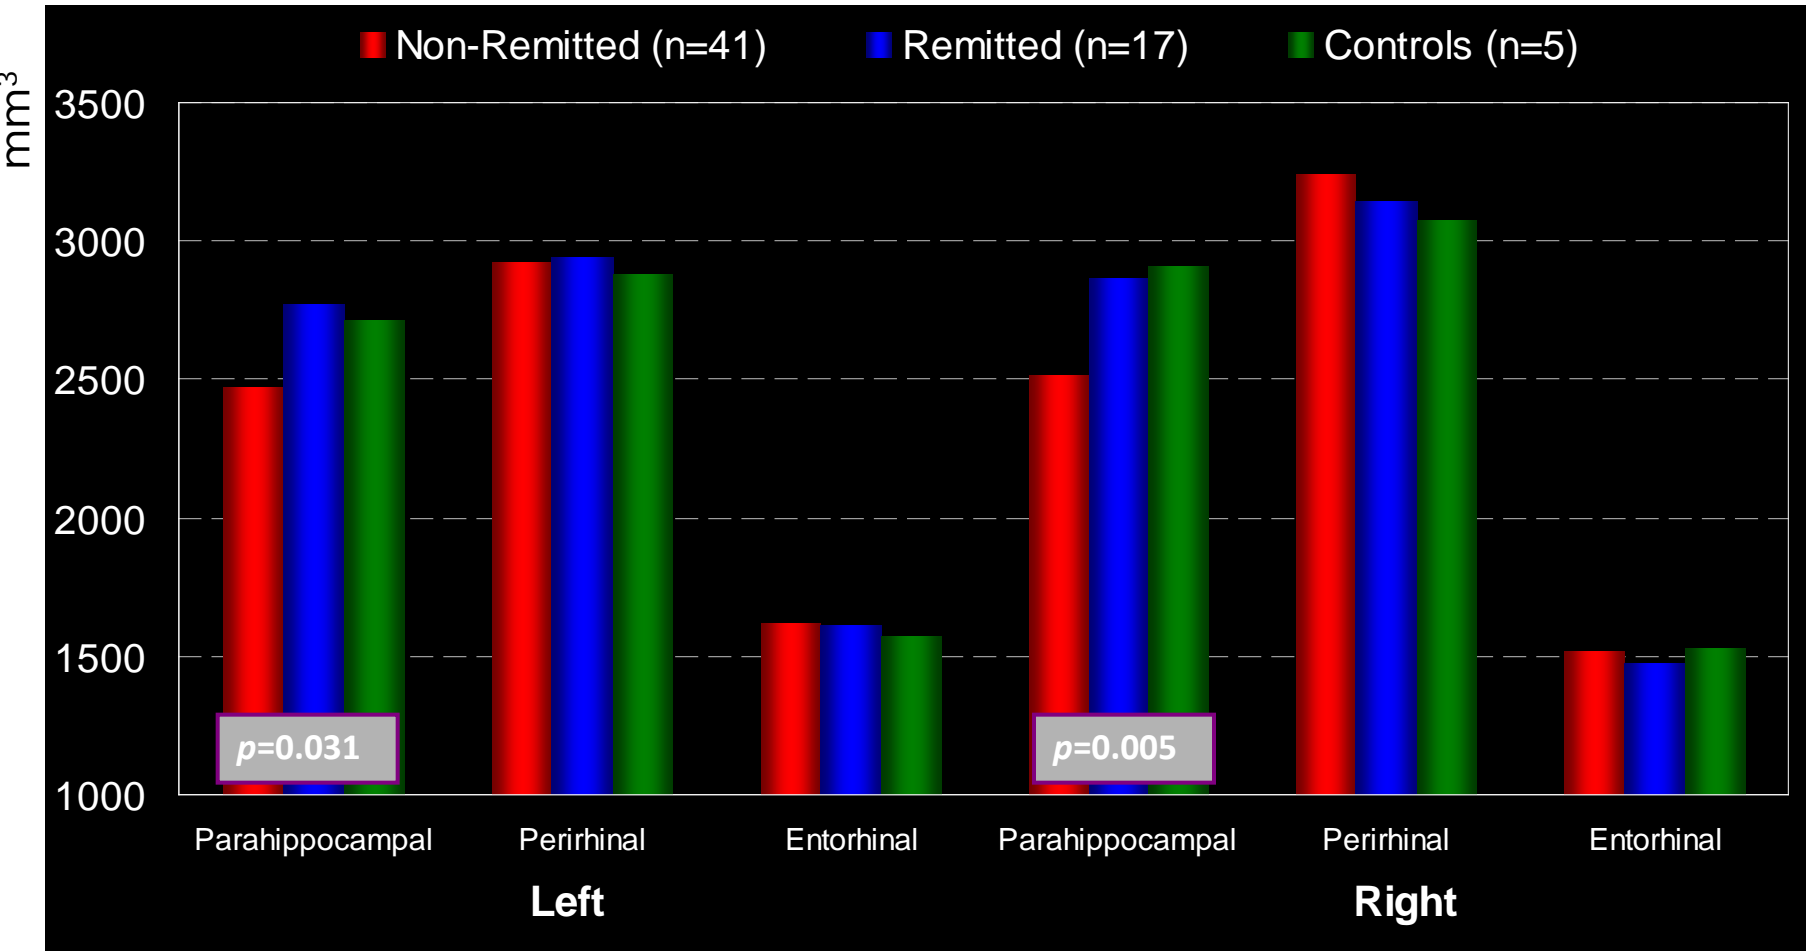

Cortical Thickness

Red = areas with less thickness in non-remitted ($p < 0.01$, corrected)

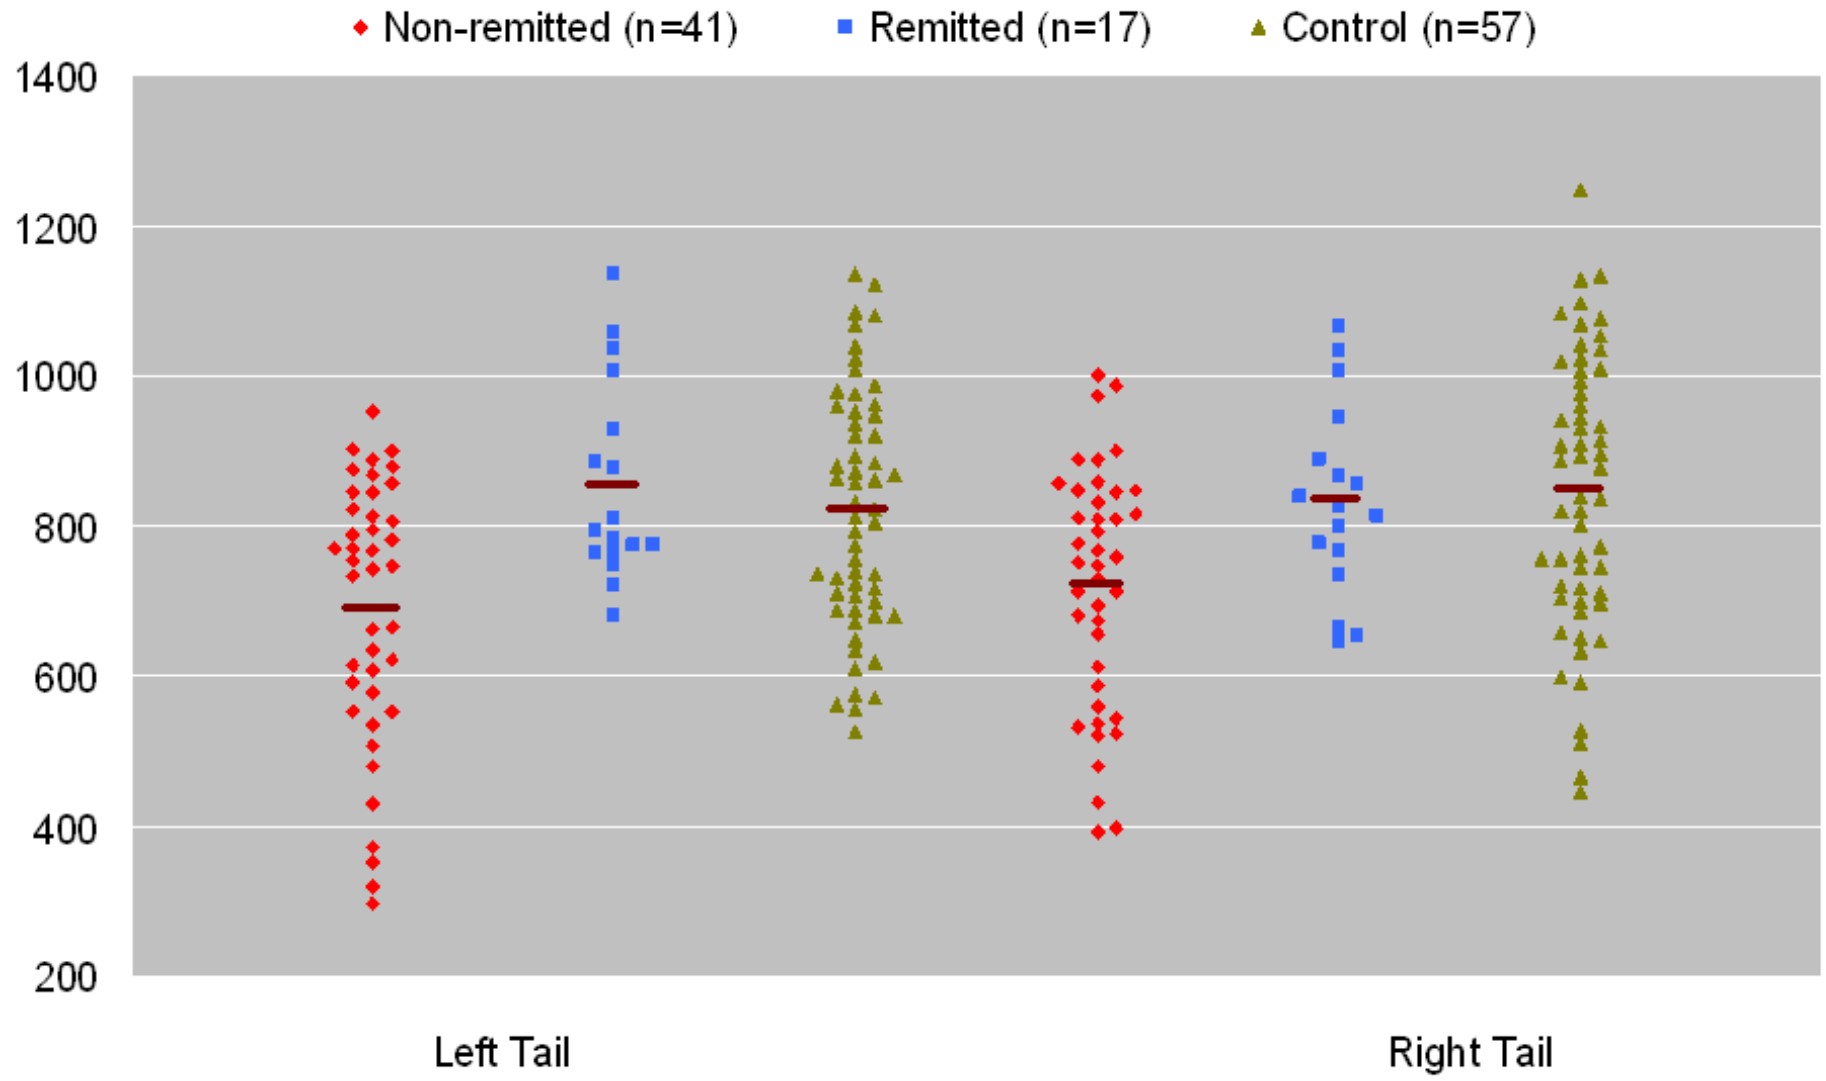

56 FES: 39 non-remitted & 17 remitted

Parahippocampal Gyrus

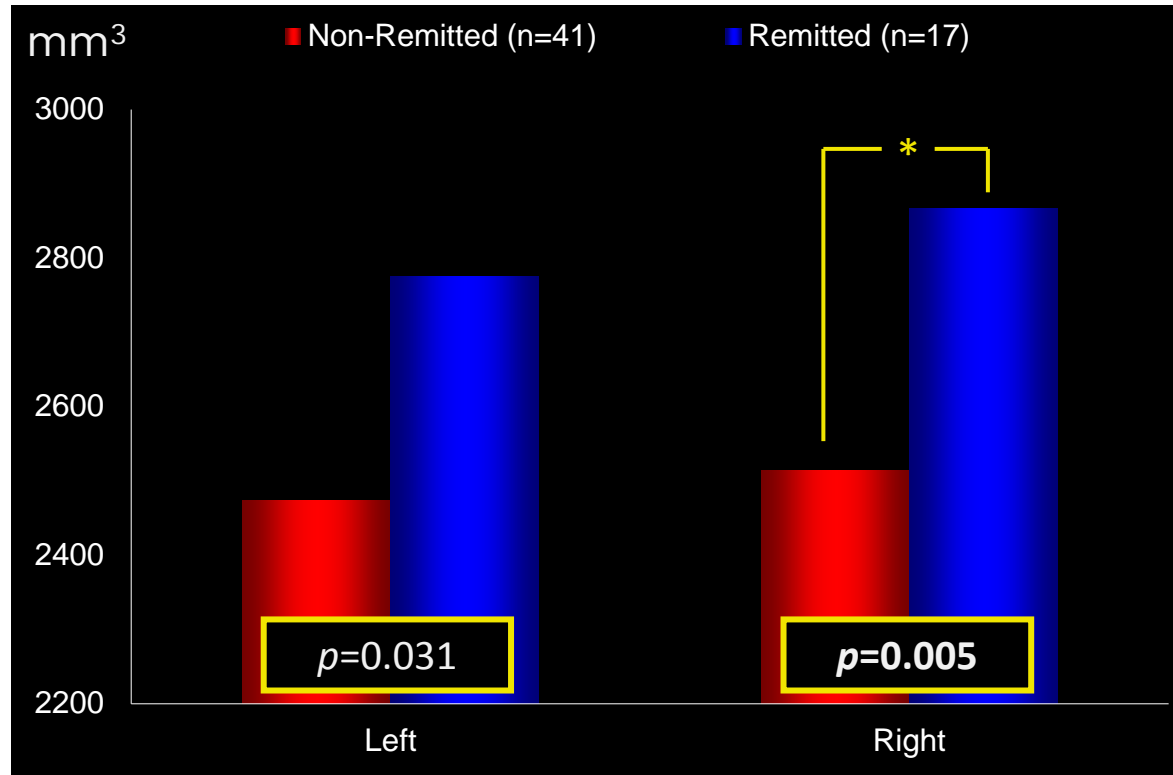

Comparison between non-remitted and remitted patients only.
No significant [group x region x side] interaction: $F=0.36$, $df=2,54$, $p=0.70$

Hippocampus Tail

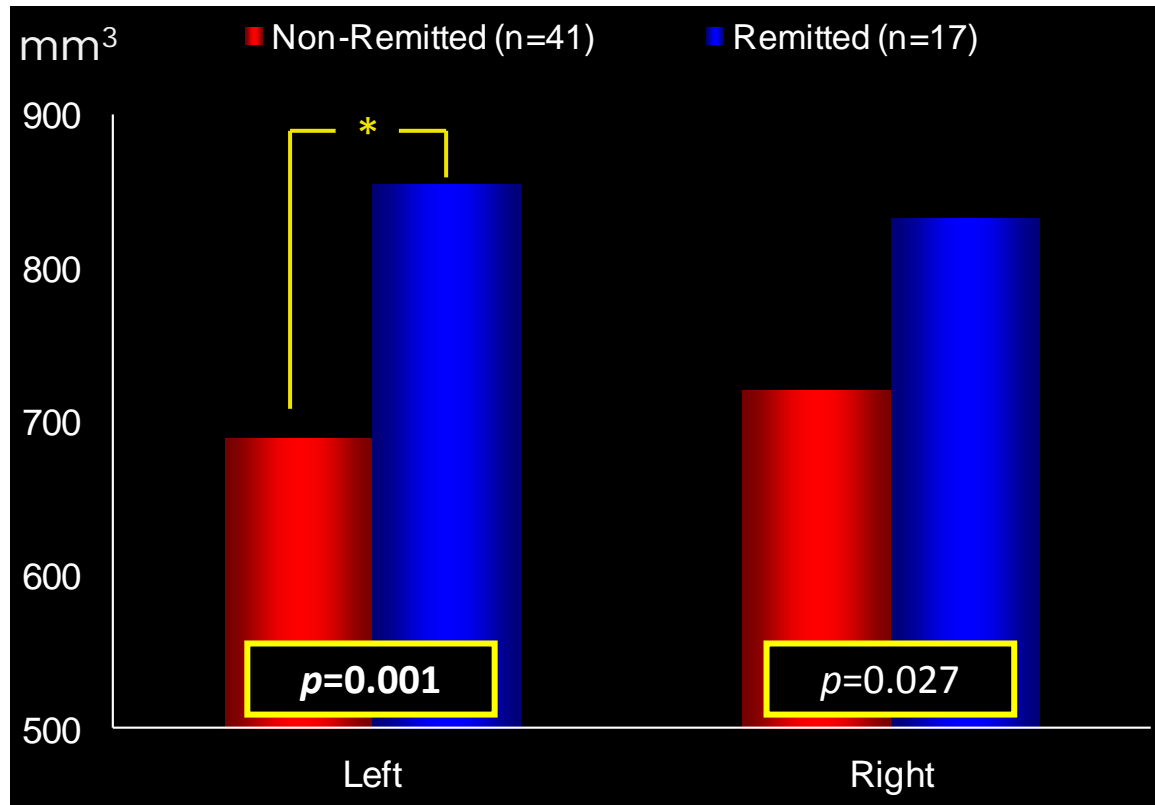

Parahippocampal Cortex

(adapted from Bodnar et al, 2012, *Psychiatry Res*)

Hippocampus Tail

No significant correlations

No significant differences in body or head subregions or amygdala

(adapted from Bodnar et al, 2010, *Schizophr Res*)

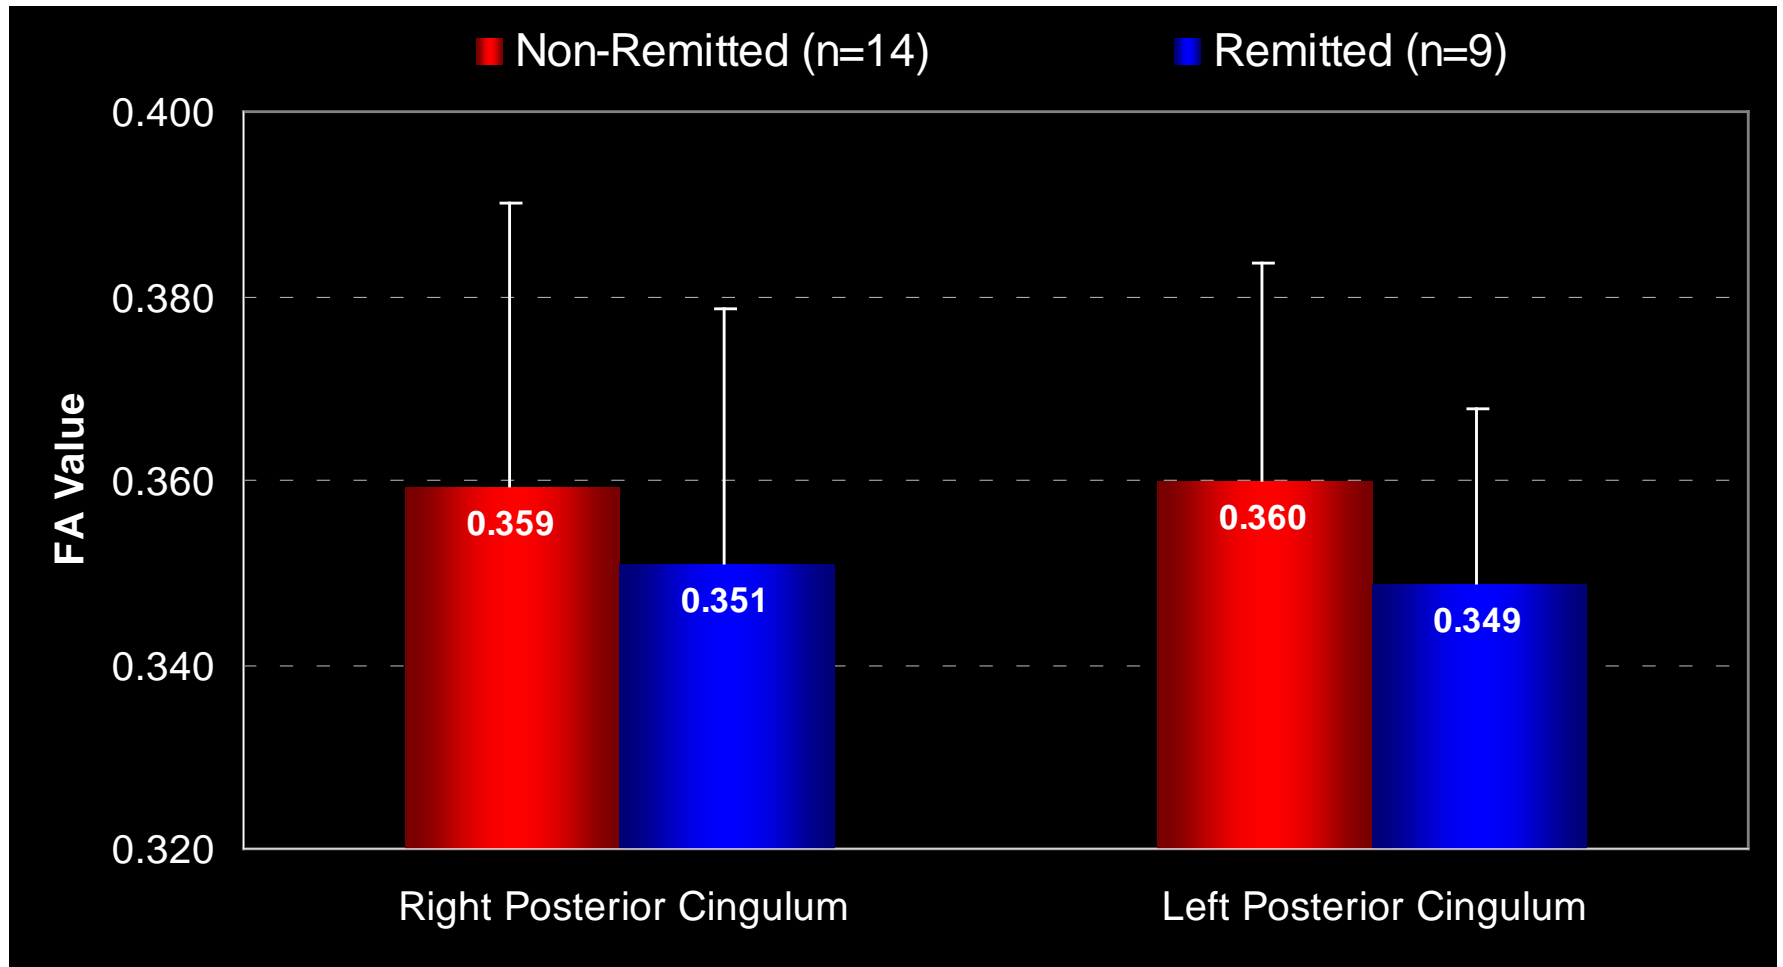

Hippocampus Tail – 1 year follow-up

■ Left
◆ Right

— Non-Remitted (n=26)
— Remitted (n=12)

DTI: posterior cingulum bundle

posterior cingulum bundle: hippocampus to cingulate

Defining remission

- Consensus definition of remission in schizophrenia published in 2005 (Andreasen et al, *Am J Psychiatry*, 2005, 162:441-449).
- Measured with PANSS, SAPS & SANS, or BPRS & SANS.
- Easily implemented in clinical trials and clinical practice.
- Can easily and directly compare studies of outcome and across cultures.

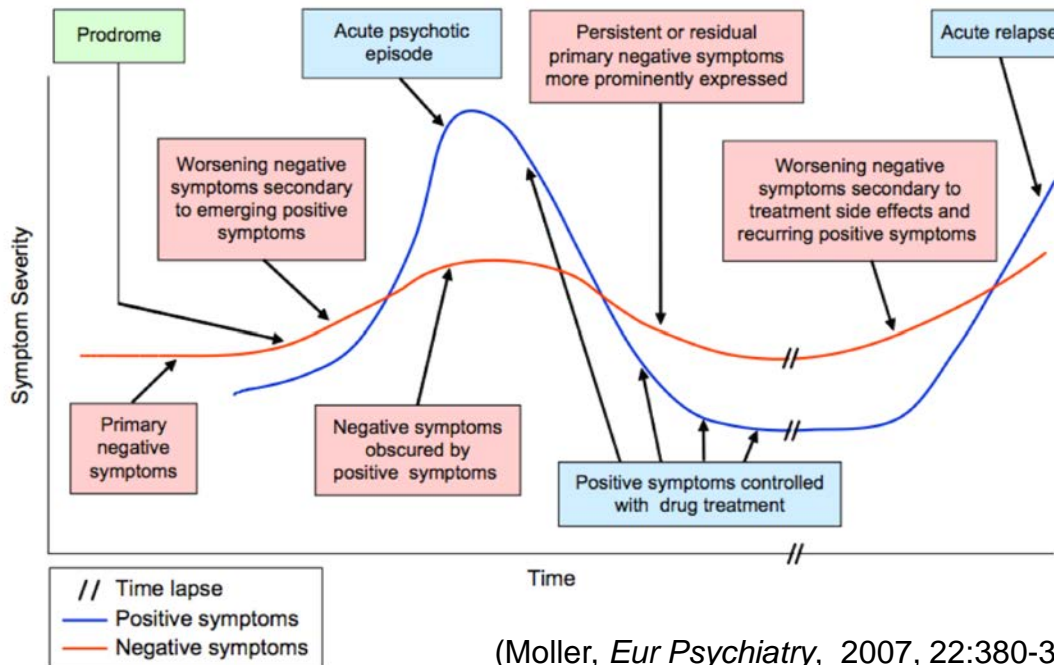

Table 1. Proposed remission criteria and relationship to diagnostic criteria

Diagnostic criteria	Remission criteria
DSM-IV (at least 2 are present)	PANSS items (score 3 or less on all items)
Delusions	P1. Delusions G9. Unusual thought content
Hallucinations	P3. Hallucinatory behaviour
Disorganized speech	P2. Conceptual disorganization
Grossly disorganized or catatonic behaviour	G5. Mannerisms/posturing
Negative symptoms	N1. Blunted affect N4. Passive/apathetic social withdrawal N6. Lack of spontaneity and flow of conversation

(van OS et al, *Acta Psychiatr Scand*, 2006, 113:91-95).

Defining remission

EXPRESSION OF POSITIVE AND NEGATIVE SYMPTOMS OVER TIME

(Moller, *Eur Psychiatry*, 2007, 22:380-386)

- Negative symptoms equally important:
 - higher baseline levels related to a poorer outcome (White et al, *Psychol Med*, 2009, 39: 1447-1456)
 - necessary to properly assess remission (Cassidy et al, *Schizophr Bull*, 2010, 36: 1001-1008).
- 6-month time component as symptoms tend to fluctuate
 - 3-month equally valid (Cassidy et al, *Schizophr Bull*, 2010, 36: 1001-1008).
